Surgery - Christian de Virgilio 2015-01-10

Surgery: A Case Based Clinical Review provides the reader with a comprehensive understanding of surgical diseases in one easy to use reference that combines multiple teaching formats. The

book begins using a case based approach. The cases presented cover the diseases most commonly encountered on a surgical rotation. The cases are designed to provide the reader with the classic findings on history and physical examination. The case presentation is followed by a series of short questions and answers, designed to provide further understanding of the important aspects of the history, physical examination, differential diagnosis, diagnostic work-up and management, as well as questions that may arise on surgical rounds. Key figures and tables visually reinforce the important elements of the disease process. A brief algorithmic flow chart is provided so the reader can quickly understand the optimal management approach. Two additional special sections further strengthen the student's comprehension. The first section covers areas of controversy in the diagnosis or management of each disease, and another section discusses pitfalls to avoid, where the inexperienced clinician might get in

trouble. The text concludes with a series of multiple choice questions in a surgery shelf/USMLE format with robust explanations. **Surgery: A Case Based Clinical Review** is based on 20 years of Socratic medical student teaching by a nine-time Golden Apple teaching awardee from the UCLA School of Medicine and will be of great utility for medical students when they rotate on surgery, interns, physician assistant students, nursing students and nurse practitioner students.

There is also a section on basic science found on the in-training exam and written boards, and a section of anesthesia, trauma, and critical care. Unlike many other books, **General Surgery Review** excludes controversial management in order to present an easy-to-remember foundation of knowledge. Thus, the book focuses on "the basics" to provide the reader with a broad command of the field. This title is indispensable to residents studying for in-training exam or boards, and is also popular with practitioners preparing for their recertification exam in general surgery.

is followed by a sequence of specific presentations organized by tumors stage or disease classification. Each discussion features a case presentation that mimics the format of a tumor board presentation and thus illustrates key diagnostic and management decisions. There is also a discussion of the evidence that supports the clinical management decisions taken in the case, based on current expert panel guidelines. Algorithms and decision tree graphics are used extensively to provide visual support of the decision process. The combination of case presentations and evidence-based management discussions make this volume a unique tool for keeping current with clinical guidelines and provides the reader with a clear understanding of applications of new information for use in daily practice.
