Materials Science-Selection of Materials - S. W. Jones 2013-10-22

Materials Science—Selection of Materials demonstrates how available physical data and knowledge of production methods can be combined at a sufficiently early stage in the design process so as to make a significant contribution toward optimum selection of materials. Topics covered in this book include material properties and material structure to selection criteria; casting technology and powder metallurgy; the economics of forming by machining processes; and factors affecting manufacturing accuracy. This

monograph is comprised of 12 chapters and begins by explaining the application of a systematic working plan for materials selection, with emphasis on the use of test data and decision taking. The chapters that follow deal with the basic strength and property problem for metals and how forming methods, with the help of subsequent treatments, can be chosen to satisfy a particular specification. A review of non-metals such as plastics precedes the final chapters that are specifically orientated to bearing materials and lubricants. In order to provide a satisfactory coverage for these transmission components, the influence of design fundamentals on material and process selection is discussed along with alternative design methods. This text will be a valuable resource for students and practitioners in the fields of materials science, physics, chemistry, engineering, and metallurgy.

Extractive Metallurgy 3 - Alain Vignes 2013-03-01

Extractive metallurgy is the art and science of extracting metals from their ores and refining them. The production of metals and alloys from these source materials is still one of the most important and fundamental industries in both developed and developing economies around the world. The outputs and products are essential resources for the metallic, mechanical, electromagnetic, electrical and electronics industries (silicon is treated as a metal for these purposes). This series is devoted to the extraction of metals from ores, concentrates (enriched ores), scraps, and other sources and their refining to the state of either liquid metal before casting or to solid metals. The extraction and refining operations that are required may be carried out by various metallurgical reaction processes. Extractive Metallurgy 1 deals with the fundamentals of thermodynamics and kinetics of the reaction processes. Extractive Metallurgy 2 focuses on pyrometallurgical, hydrometallurgical, halide and electro-metallurgical (conversion) processes. Extractive Metallurgy 3 deals with the industrial processing operations, technologies, and process routes, in other words the sequence of steps or operations used to convert the ore to metal. Processes and operations are studied using the methodology of "chemical reaction engineering". As the fundamentals of the art and science of Extractive Metallurgy are infrequently taught as dedicated university or engineering schools courses, this series is intended both for students in the fields of Metallurgy and Mechanical Engineering who want to acquire this knowledge, and also for engineers put in charge of the operation of an industrial production unit or the development of a new process, who will need the basic knowledge of the corresponding technology.

Metallurgy - W.H. Dennis 2017-07-12

The world's output of metals during the 100 year period of 1863-1963 was greater than in all the previous years of man's history. In the nineteenth century the only metals available to industry were cast and wrought iron and a few non-ferrous metals and their alloys; by the latter part of the twentieth century, steel and aluminum dominated the world, and metals that were mere laboratory curiosities provided the basis for the technology of nuclear energy and space travel. This book records the extraordinary history of the metallurgical progress, in which metal art was replaced by metal science. It remains a classic work on the subject. The book begins with an introductory chapter that surveys the entire field to be covered, and follows with eight chapters each dealing with progress in one of the major branches of the metallurgical industry: ore dressing, pyrometallurgy, iron and steel, the major non-ferrous metals, new metals (such as uranium, germanium and cobalt), precious metals, the shaping of metals, and metallography. The book reviews developments in all countries, but American practice - which led the world - is given special prominence. A glossary of metallurgical terms and full name and subject indexes are included. The book is a basic reference work as well as an absorbing history of an important aspect of man's technological

progress.

The Complete Book on Ferrous, Non-Ferrous Metals with Casting and Forging Technology - NIIR Board of Consultants and Engineers 2011-06-03

The Casting and Forging product is playing a greater role in our everyday lives and is essential than it has ever been. The Casting and Forging industry fortunes is largely dependent on the level of activity within the construction (building and non-building) and automotive sectors. Ferrous and non ferrous metals and its alloys accounts for a large portion of all metal production. Metal ingots and billets are formed by a casting process. The Casting process has traversed a long path and impacted human civilization for nearly five millennia. For any metal casting process, selection of right alloy, size, shape, thickness, tolerance, texture, and weight is very vital. Casting process involves melting the metal to be used, pouring it into a mould, letting it cool and then knocking out the casting. On the other hand, forging is one of the oldest known metal working processes. Forging technology occupies a very important place among all the manufacturing processes as it produces parts with excellent properties and with minimal wastage. Forging involves the use of machinery with a hammering or pressing action to convert basic shapes into a pre-determined form. Forging has the capacity to refine the grain structure and improve the physical properties of the metal. Forging products are consistent, without the defects of porosity, inclusion or voids, and finishing operations like machining, coining, sizing, straightening or surface treatments can also be easily done. This handbook

gives a concise description of the fascinating on the state-of-the-art technology of the casting and forging process of metals and metal alloys. This book contains precise details on production of ferrous and non ferrous metals, its casting and forging process along with their alloys. It is hoped that this book will find very helpful to all its readers who are just beginners in this field and will also find useful for existing industries, technocrats, technical institutions, etc.
